BILATERAL DIGITAL DIAGNOSTIC MAMMOGRAM 3D/2D AND TARGETED RIGHT ULTRASOUND:
No
Real-time ultrasound of the right breast was performed.

The breasts are heterogeneously dense, which may obscure small masses.
Digital mammography views were performed including tomosynthesis.

Patient right breast.

Irregular spiculated high density mass within the upper inner right breast middle depth with associated pleomorphic calcifications measures approximately 5.8 x 4.0 x 3.5 cm (oblique TV, oblique AP, CC). There is skin thickening of the right breast predominantly involving the medial and inferior aspects. There is also mild right nipple retraction.

ULTRASOUND:
Targeted ultrasound of the palpable area of concern in the right breast 2:00 3 cm from the nipple demonstrates an irregular hypoechoic mass with internal specular reflections measuring approximately 6.0 x 2.4 x 4.0 cm. Skin thickening noted within the lower inner quadrant measuring up to 6 mm.

Targeted ultrasound of the right axilla demonstrates an abnormal lymph node versus 2 adjacent abnormal lymph nodes, which is also palpable to the patient.

IMPRESSION: HIGHLY SUGGESTIVE OF MALIGNANCY, ULTRASOUND HIGHLY SUGGESTIVE OF MALIGNANCY
1. Right breast mass is highly suspicious of malignancy.
2. Right breast skin thickening for which clinical evaluation is recommended for possible punch biopsy.
3. Abnormal right axillary lymphadenopathy is suspicious.

Ultrasound-guided biopsy of the right breast mass and abnormal axillary lymph node is recommended.
