### Final Diagnosis

1. Breast, Left; us left breast biopsy 7:00 periareoler; US BREAST CORE BIOPSY LEFT:

- Invasive carcinoma type
  - Invasive mammary carcinoma
- Tumor size
  - Invasive carcinoma spans at least 3.5 mm in this material
- Differentiation
  - Moderately to poorly differentiated
- Results of immunohistochemical studies
  - Will be reported in an addendum

I ATTEST THAT THE ABOVE DIAGNOSIS IS BASED UPON MY PERSONAL EXAMINATION OF THE SLIDES (AND/OR OTHER MATERIAL), AND THAT I HAVE REVIEWED AND APPROVED THE REPORT.

DILIP D GIRI, MD

## Study Result

### Narrative & Impression

ACCESSION#(s):

DATE:

EXAM: BILATERAL DIAGNOSTIC MAMMOGRAM. Limited bilateral ultrasound.

CLINICAL HISTORY: Annual mammogram. Status post right conservation surgery.

TECHNIQUE: Mammographic examination was performed using full breast digital technique. Limited bilateral ultrasound.

COMPARISON(S): 2024 dating back to 2020

LAST CLINICAL BREAST EXAM: Within the past year

BREAST DENSITY: Scattered areas of fibroglandular density.

### FINDINGS:

No asymmetry in the outer middle depth right breast resolves with spot compression imaging. Limited same day right breast ultrasound demonstrate normal fibroglandular tissue in the outer right breast.

Within the lower inner periareolar anterior depth left breast there is an irregular high dense spiculated mass with associated overlying skin retraction. Limited same day left breast ultrasound demonstrates an irregular shadowing hypervascular hypoechoic mass in the 7:00 periareolar left breast measuring 0.3 x 0.4 x 0.4 cm. This corresponds to mammographic abnormality.

### IMPRESSION:

Left breast mass. Ultrasound-guided biopsy recommended.

BI-RADS 4 - Suspicious

RECOMMENDATION(S):  
Ultrasound-guided breast biopsy- Left

Electronically Signed By: NICOLE SAPHIER MD on 1:22 PM
