DATE: 2:16 PM

EXAM: REVIEW OF SUBMITTED BREAST IMAGING:

BILATERAL MAMMOGRAM WITH TOMOSYNTHESIS

Technique: bilateral mammogram: tomosynthesis images were obtained.

BILATERAL COMPLETE BREAST ULTRASOUND

Technique: bilateral breast us: whole breast ultrasound was performed, including sonographic evaluation of all four quadrants and the retroareolar tissues.

CLINICAL HISTORY: Palpable right breast DCIS, MSK path review pending.

COMPARISON(S): Multiple priors dating from to

FINDINGS:

MAMMOGRAM:

BREAST DENSITY: Heterogeneously dense, which may obscure small masses.

RIGHT BREAST:

* Metallic BB overlies the periareolar 12:00 breast denoting the area of palpable concern. Incompletely characterized calcifications are noted along the 12:00 axis anterior and middle third depth spanning 3.7 cm on routine and spot MLO views; magnification views are recommended.

LEFT BREAST:

No

ULTRASOUND: Evaluation is limited as interpretation is based on static images.

RIGHT BREAST:

* Area of pain/palpable concern in the 2:00 breast 2 cm from the nipple, 1.3 x 1 x 2.4 cm heterogeneously hypoechoic masslike area with adjacent vascularity

* Indeterminate hypoechoic areas in the 12:00 breast 3 cm from the nipple measuring 0.4 x 0.3 x 0.4 cm, 12:00 breast 2 cm from the nipple measuring 0.6 x 0.3 x 1.1 cm

On ultrasound-guided core biopsy was performed of the 2:00 mass, remeasured as 1.6 x 0.9 x 1.4 cm, with needle traversing it and a Q marker placed. Postprocedure mammogram demonstrates marker in the expected position. Calcifications described above are noted posterior to the marker. Pathology demonstrated DCIS, MSK path review pending.

RIGHT AXILLA: Normal lymph nodes.

LEFT BREAST: No in the 11:00 breast 3 cm from the nipple (previously annotated at the 11:00 breast 5 cm from the nipple on 2:00 breast 4 cm from the nipple, and retroareolar breast as well as stable 1 cm mass in the 7:00 retroareolar breast annotated as previously biopsied.

LEFT AXILLA: Not imaged.

ADDITIONAL IMAGING RECOMMENDED: Right diagnostic mammogram (magnification views) and targeted

ultrasound.

- IMPRESSION:
- 1. Palpable right breast DCIS with Q marker in adequate position status post ultrasound-guided core biopsy, MSK path review pending.
 - 2. Incompletely characterized right calcifications posterior to the malignant Q marker; magnification views are recommended.
 - 3. Indeterminate right 12:00 breast sonographic masses. Targeted ultrasound is recommended.
 - 4. No breast.
