***Future Care: Sensors, Artificial Intelligence, and the Reinvention of Medicine* by Jagmeet Singh**

Health care is in a state of transition.

Over the next few decades, the practice of medicine will become increasingly virtual, aided by digital technologies like artificial intelligence, telehealth, and wearable devices.

Harvard Medical School professor Jagmeet Singh is witnessing many of these changes firsthand. His new book, *Future Care: Sensors, Artificial Intelligence, and the Reinvention of Medicine*, draws from his work as a cardiologist, his research into

device technologies, and his own experience being hospitalized with COVID-19 to explore the rapidly changing health care landscape.

Singh avoids painting a dystopian picture. Instead, he explains how we might understand and adapt to technological changes to support a more equitable, accessible, and accountable health care system.

In this episode of The Written Word, *Harvard Medicine* speaks with Singh about the genesis of the book and the important lessons he hopes readers will take from it.

Singh is a professor of medicine at HMS and a practicing cardiologist at Massachusetts General Hospital. As a clinician-scientist, his research has focused on innovative device therapies, sensors, AI, and virtual care.
