

! Mammo Diagnostic W Tomosynthesis Right

Anatomical Region
Breast

Laterality
right

Modality
Mammography

Impression

Persistent architectural distortion at the right breast 9:00 axis, 4 cm the nipple is found to be a solid mass by ultrasound. This is considered suspicious based on the appearance on mammography and ultrasound.

Recommendation: Right ultrasound-guided core needle biopsy is recommended for definitive histologic diagnosis. A core needle biopsy and clip placement were discussed with the patient [REDACTED] interested in core biopsy for diagnosis and will schedule an appointment with us for the procedure before she leaves the department today.

BI-RADS code: 4 - Suspicious.
4C High suspicion for malignancy.

This document passed e-signature verification by Dr. Amanda J Ferrell on [REDACTED] 3:05 PM

Narrative

UNILATERAL RIGHT DIGITAL DIAGNOSTIC MAMMOGRAM with TOMOSYNTHESIS AND RIGHT BREAST ULTRASOUND

Procedure Date/Time: [REDACTED] 1:30 PM

History: This is a 70-year-old asymptomatic woman who presents today for additional images of a questioned architectural distortion at about the 9:00 axis at middle depth and another in the lateral and posterior right breast. There is no [REDACTED]

Comparison: [REDACTED]

Technique: Tomosynthesis and 2-dimensional spot compression and 90 degree images are obtained and reviewed.

Findings:

Density: The breasts are heterogeneously dense, which may obscure small masses.

Right Breast: No [REDACTED] microcalcifications. There is a persistent architectural distortion at about the 9:00 axis at the junction of the anterior to middle one thirds of the breast tissue. This is 0.8 x 0.6 x 1.0 cm. The questioned area of distortion at the slightly lateral and posterior right breast, at the posterior fat parenchymal junction, has effaced.

Right ultrasound: At the 9:00 axis, 4 cm the nipple there is a hypoechoic mass with ill-defined margins. This is irregular is oriented parallel to the skin
