EXAM: REVIEW OF SUBMITTED BREAST IMAGING:

BILATERAL MAMMOGRAM WITH TOMOSYNTHESIS August 4, 2025:
Technique: bilateral mammogram: tomosynthesis images were obtained.

BILATERAL LIMITED BREAST ULTRASOUND August 4, 2025:
Technique: bilateral breast us: limited breast ultrasound was performed.

BILATERAL BREAST MRI WITH AND WITHOUT IV CONTRAST September 19, 2025:
Technique: bilateral breast MR: multiplanar, multisequence MR images were obtained before and after intravenous administration of gadolinium-based contrast agent.

CLINICAL HISTORY: Newly diagnosed right breast cancer (MSK pathology review pending). Evaluate outside imaging.

COMPARISON(S): Multiple prior exams, most recent September 25, 2023 and September 12, 2023

FINDINGS:

MAMMOGRAM:

BREAST DENSITY: Heterogeneously dense, which may obscure small masses. Unchanged appearance of bilateral areas of oil cysts and microcalcifications.

RIGHT BREAST: In the upper outer quadrant of the right breast, posterior depth, best appreciated on the MLO view, is a 0.7 cm spiculated mass. The finding persists on same day spot compression views.

The patient mass on September 25, 2025. Post procedure mammogram shows a well-positioned stoplight biopsy marker in the upper outer right breast approximately 1 cm laterally displaced. And outside pathology showed invasive ductal carcinoma.

LEFT BREAST: No

ULTRASOUND: Evaluation is limited as interpretation is based on static images.

RIGHT BREAST: Hypoechoic mass at the 10:00 axis, 10 cm from the nipple measuring 0.3 x 0.5 x 0.2 cm. This mass underwent ultrasound-guided biopsy on August 8, 2025. Same day post procedure mammogram shows a Top-Hat biopsy marker within the upper outer right breast, posterior depth however not associated with the originally visualized mammographic mass. Outside pathology yielded benign results of benign breast tissue with focally prominent stromal fibrosis which is concordant with the sonographic appearance.

RIGHT AXILLA: Not imaged.

MRI:

BREAST COMPOSITION: Heterogeneous fibroglandular tissue with marked parenchymal enhancement.

RIGHT BREAST: In the upper outer quadrant of the right breast, posterior depth, is a heterogeneously enhancing mass measuring 0.8 x 0.7 cm, corresponding to mass seen mammographically.

LEFT BREAST: No

OTHER: None.

ADDITIONAL IMAGING RECOMMENDED: None

IMPRESSION:
Newly diagnosed right breast cancer with associated stoplight biopsy marker 1 cm laterally displaced. Appropriate action is recommended pending MSK pathology review.

No
