Exam requested by:
MINGKE WANG MD
139 CENTRE ST, STE PH102
NEW YORK NY

SITE PERFORMED: LHR COBBLE HILL
SITE PHONE: (718) 282-7000

Patient:
Date of Birth:
Phone: (917) 674-8280
Date of Exam:

Addendum 1 -**BREAST SURGICAL PATHOLOGY ADDENDUM:**

Left breast 1 o'clock axis calcifications, core biopsy:

- Ductal carcinoma in situ, intermediate to high nuclear grade, solid increased performed patterns with necrosis and calcifications.
- Lymph node, negative for metastatic carcinoma.

Left breast 2 o'clock axis calcifications, core biopsy:

- Ductal carcinoma in situ, intermediate to high nuclear grade, solid increased performed patterns with necrosis and calcifications.
- skeletal muscle

Pathology results indicate that the specimen is malignant.

The pathology results are concordant with the imaging.

Contrast-enhanced breast MRI is recommended to evaluate the extent of disease. Breast surgery consultation is recommended for further management.

The critical results pathway was initiated on 3:17 PM to facilitate the communication of these results and recommendations to the referring provider.

Thank you for the opportunity to participate in the care of this patient.

CAROLYN M HANNA MD - Electronically Signed: 3:17 PM
Physician

Patient: [REDACTED]

Date of Birth: [REDACTED]

HISTORY: The patient is 55 years old and was referred for stereotactic biopsies of calcifications at the left 1 o'clock axis and calcifications at the left 2 o'clock axis.

COMPARISON: Prior breast imaging studies dated 9/14/2025

PROCEDURE: The procedure was explained to the patient, [REDACTED] not limited to infection and bleeding, were reviewed. All questions were answered, and the patient [REDACTED] procedure, signing the consent form. Universal timeout was performed.

SITE 1:

A scout film and subsequent prefire tomosynthesis imaging shows the suspicious calcifications within the operating window.

Using sterile technique, 10 mL of 1% lidocaine and 10 mL of 1% lidocaine with epinephrine was administered. An introducer needle was placed prior to insertion of the biopsy needle. Biopsy was performed using a 9-gauge EVIVA vacuum-assisted breast biopsy standard needle utilizing a lateral-medial approach. Confirmatory pre-and post-fire images demonstrate adequate placement of the biopsy needle. The usual number [REDACTED] specimen radiograph confirms the presence of calcifications.

A hourglass shaped Eviva biopsy clip was deployed at the biopsy site. Residual calcifications were present post core biopsy.

SITE 2:

A scout film and subsequent prefire tomosynthesis imaging shows the suspicious calcifications within the operating window.

Using sterile technique, 10 mL of 1% lidocaine and 10 mL of 1% lidocaine with epinephrine was administered. An introducer needle was placed prior to insertion of the biopsy needle. Biopsy was performed using a 9-gauge EVIVA vacuum-assisted breast biopsy standard needle utilizing a lateral-medial approach. Confirmatory pre-and post-fire images demonstrate adequate placement of the biopsy needle. The usual number [REDACTED] specimen radiograph confirms the presence of calcifications.

A top hat shaped Eviva biopsy clip was deployed at the biopsy site. Residual calcifications were present post core biopsy.

A postprocedure mammogram demonstrates appropriate placement of the clips.

The patient [REDACTED]
The specimens were subsequently sent to the pathology lab.

IMPRESSION: 2 site stereotactic biopsies performed.

Pathology results and concordance will follow as an addendum to this report.
