DOB: 8/8/1977
Patient: [REDACTED]
Exam Date: 8/1/2025 02:46 PM
CC: QILI LI, MD

Acc #: 10004224
Secondary ID: [REDACTED]
Exam Name: [REDACTED]

EXAM: MA 3D DIGITAL SCREENING MAMMOGRAPHY, US BREAST BILATERAL

History: Patient [REDACTED] screening. Breast ultrasound to evaluate dense breasts. The patient [REDACTED] at age 40 - benign. The patient [REDACTED] no [REDACTED] no [REDACTED]

Last reported clinical breast exam: Within the past year
Risk factors:

NCI 5 year: 1.1%
NCI Lifetime: 9.8%

Views obtained: Bilateral 3-D tomosynthesis MLO/CC views.
Digital mammography was performed with additional image analysis utilizing CAD. Deep learning algorithms (AI) were applied to mammography images and DBT slices as a concurrent reading aid.

Comparison: [REDACTED] (mammogram), [REDACTED] (mammogram), [REDACTED] (mammogram) and 07/26/2024 (mammogram).

FINDINGS:

The breast tissue is heterogeneously dense, which may obscure small masses.

Right lower central breast, posterior depth there is nodular focal asymmetry.

Scattered benign punctate calcifications are again noted. Left central breast, middle depth there is a 0.8 cm nodule, stable. The left breast demonstrates no [REDACTED] abnormalities.

BILATERAL BREAST ULTRASOUND, performed around the clock:

Main Street RadiologyName: XULI MA
Date of Birth: 8/8/1977Comparison: 7/26/2024, 7/7/2023, 7/22/2022.
Breast composition: Heterogeneous**RIGHT BREAST:**

2:00, 2 cm from nipple is a hypoechoic lesion measuring 0.5 cm, stable.

6:00, 4 cm from nipple there is an irregular mass measuring 0.7 x 0.7 x 0.7 cm, newly visualized. There is an adjacent/abutting irregular mass measuring 0.5 x 0.4 x 0.4 cm This correlates with the right lower central breast mammographic nodule focal asymmetry. In its entirety, the 2 nodules measuring approximately 1.2 cm. Ultrasound-guided biopsy is recommended.

No [REDACTED]

LEFT BREAST:

11:00, 2 cm from nipple there is a circumscribed nodule measuring 0.8 cm, unchanged.

No [REDACTED]

IMPRESSION:

Right 6:00 sonographic abutting irregular masses measuring 0.7 cm and 0.5 cm, which correlate with the right lower central mammographic nodule focal asymmetry. Ultrasound-guided core needle biopsy (x1) with clip placement and postprocedural mammogram is recommended.

RECOMMENDATION:

Recommendation: Ultrasound Biopsy. Right breast ultrasound-guided core needle biopsy clip placement and postprocedural mammogram.

BI-RADS CATEGORY: 4 - Suspicious Abnormality

Message left with medical secretary at Dr. YUAN YI LI MD's office on [REDACTED] 10:06 AM. A copy of this report will be faxed to the doctor's office.

A letter has been sent to the patient [REDACTED] reminder system with a target due date for their next mammogram.

Approximately 10% of breast carcinomas are not radiographically detectable. A negative report should not delay biopsy if a clinically suspicious mass is present. Dense breasts may obscure an underlying neoplasm.

BIRADS 0: Incomplete - Need Additional Imaging Evaluation and/or Prior Mammograms for Comparison**BIRADS 1: Negative****BIRADS 2: Benign****BIRADS 3: Probably Benign****BIRADS 4: Suspicious Abnormality - Biopsy should be considered.****BIRADS 5: Highly Suspicious of Malignancy**This fax was sent with GFI FaxMaker fax server. For more information, visit: <http://www.gfi.com>

Name:

Date of Birth: 8/8/1977

BIRADS 6: Known Malignancy

The New York State Department of Health requires us to indicate the date of the patient's last clinical breast examination.

If NCI risk has been calculated, the results are based on information provided by the patient.
